# Chapter 1

Figure 1.1:

## Introduction

It is no surprise that often people experience strong emotional responses in their bodies. However, physical symptoms, particularly gastrointestinal symptoms, have scarcely been studied as a measure of emotional arousal. This study will explore the relationship between physical and emotional symptoms and health. In addition, we will explore the impact of the COVID-19 pandemic on physical and emotional health.

## 1.1 Summary

The purpose of this two-part study is to explore the relationship between somatic symptoms and emotions in adults.

Recruitment target:  $N = 150$ .

### 1.1.1 Study 1 - COVID-19

Part 1 will be an online study that will explore the relationship between emotions and somatic symptomatology in the wake of the COVID-19 pandemic, while exploring individual differences in social, environmental, personality, and lifestyle

factors which may mitigate or exacerbate the negative psychological impact of this stressor.

Participants will complete a range of questionnaires assessing social and emotional functioning, physical health symptoms, early life adversity, physical health, and a range of questionnaires assessing the impact of COVID-19.

### 1.1.2 Study 2 - EGG

Part 2 will be an in-person study that will explore the relationship between gastrointestinal activity and emotions utilizing electrogastrography.

Participants who had previously completed Part 1 will return for an in-person session in the lab in which they will watch a series of sad, scary, and neutral movies while electrophysiology recordings are made. Then they will complete a range of questionnaires assessing social and emotional functioning, physical health symptoms, early life adversity, and physical health assessments.

---

## 1.2 Keywords

stress, emotions, mental health, somatic symptoms, egg, physiology

---

## 1.3 Background

While we often describe our emotions as “gut feelings”, surprisingly little research has examined how emotions and the gastrointestinal system interact. Given the onset of a global pandemic, the situation provides a unique opportunity to investigate how an emotion inducing real-world event, COVID-19, might influence somatic symptoms and the stress response.

Prior research during public health crises, such as the SARS epidemic in 2006, reveal that the stress associated with quarantine during the epidemic was associated with higher symptoms of acute stress disorder and later post traumatic stress symptoms (Bai et al., 2004). However, research also reveals that in the wake of the SARS epidemic, individuals found their friends and family members more supportive (Lau, Yang, Tsui, Pang, & Wing, 2006). Similarly, research suggests that social support obtained through social interactions after the events of September 11th, 2001 reduced college students’ symptoms of both depression and physical illness (MacGeorge, Samter, Feng, Gillihan, & Graves, 2004).

Given that gastrointestinal and mental health problems are highly comorbid, with anxiety five times higher in individuals with irritable bowel syndrome (IBS)

than in those with no IBS symptoms (Lee et al., 2009), gastrointestinal and somatic symptoms may serve as a useful indicator of emotional functioning, particularly during this period of heightened awareness of physical health amid the COVID-19 pandemic. For example, stress in early life can affect both emotional and gastrointestinal symptoms and functioning. One study demonstrated that previous adverse care experiences were associated with both increased anxiety and incidence of gastrointestinal symptoms in youth (Callaghan et al., 2019). In addition, early adversity was associated with changes in gastrointestinal microbiome diversity that were correlated with neural activation to emotional faces (Callaghan et al., 2019).

Physiological methods such as heart rate and sweat response are common indicators of emotional arousal, but the electrogastrogram (EGG) is seldom used in psychological research. In one study, researchers found that movie clips capturing emotions of fear, disgust, and sadness, elicited a greater EGG response relative to a neutral condition (Vianna & Tranel, 2006).

Few studies have explored the way that individual differences including early stress, social support, media consumption, and lifestyle factors may mitigate or exacerbate the negative somatic psychological impact of a stressor as well as the way that these variables and emotional functioning may influence the EGG response to negatively emotionally arousing movie clips.

Using questionnaires and electrogastrography, we seek to investigate the relationship between somatic symptoms (particularly gastrointestinal symptoms), gastric myoelectrical activity, and emotional functioning, in the context of a public health crisis as well as during emotionally arousing movie clips. We also hope to explore factors that might influence gastrointestinal responses to emotional arousal, and whether and how physical sensations are associated with emotions and physiological responses. We also hope to evaluate how EGG sits with other physiological measures, such as heart rate and sweat response, in order to explore whether emotional patterning of physiological responses contribute to meaningful differences in emotion regulation, the stress response, and mental health.

---

## 1.4 Specific Aims

### 1.4.1 Study 1 - COVID-19

1. Establish a relationship between psychological stress and somatic symptoms as assessed by our newly developed Somatic Symptoms of Negative Affect (SOMNA) Questionnaire.
2. Investigate the individual differences that might influence the somatic and psychological response to stress (such as early life stress, social support, media consumption, diet and exercise, lifestyle habits, trait variables, etc.)

3. Examine how specific somatic symptoms in the context of stress may relate to mental health

#### **1.4.2 Study 2 - EGG**

1. Establish a relationship between emotionally arousing stimuli and the EGG response
2. Investigate the individual differences that might influence the EGG response to stress (such as early life stress, current stress, trait variables, etc.)
3. Examine how the EGG response sits with other physiological indices (such as heart rate and sweat response)
4. Explore the ways in which physical sensations are associated with emotions and physiological responses

## Chapter 2

# Study 1 - COVID - Methods

### 2.1 Measures

#### 2.1.1 Information

| Title           | Name                         | Description  | Reference      |
|-----------------|------------------------------|--|----------------|
| info            | Information questionnaire    | Assesses demographics, health, and location information  | Made by BABLab |
| covid_objective | Objective impact of COVID-19 | Assesses the objective impact of COVID-19 including infection, quarantine, household, social distancing etc. | Made by BABLab |

#### 2.1.2 Somatic

| Title      | Name   | Description  | Reference      |
|------------|--|--|----------------|
| somna      | Somatic markers of negative affect                           | Assesses physical sensations of anxiety and sadness, where they are located, and their intensity                                 | Made by BABLab |
| maia       | Multidimensional Assessment of Interoceptive Awareness       | Multidimensional self-report measure of interoceptive body awareness   |                |
| hai        | Health anxiety inventory                                     | Assesses people's anxiety about health symptoms (hypochondriasis)  |                |
| ss         | Somatic symptoms   | Assesses a range of somatic symptoms in adult participants   |                |
| pill       | Pennebaker inventory of libid languidness                    | Measures people's tendency to notice and report a broad array of physical symptoms and sensations.                               |                |
| pedsq_l_gi | Pediatric Quality of life – Gastrointestinal Symptoms Module | Assess incidence of Gastrointestinal Symptoms and fatigue in children  |                |
| med_check  | Medication checklist   | List of medications that participants are on – needed for physiology analyses as well as verification of physical health issues. |                |

| Title                      | Name                                     | Description   | Reference |
|----------------------------|--|---|-----------|
| gastrointestinal_disorders | Gastrointestinal disorders questionnaire | Assesses gastrointestinal issues, their frequency and intensity   |           |
| rome                       | Rome IV criteria questionnaire           | Assesses the presence of symptoms which meet criteria for irritable bowel syndrome as stated by the Rome IV   |           |
| menstrual_cycle            | Menstrual cycle questionnaire            | Assesses menstrual phase, which affects gastrointestinal responding, as well as medications which may affect menstrual phase such as oral contraceptive use |           |
| psst                       | Premenstrual symptoms screening tool     | Assesses premenstrual syndromes and criteria for premenstrual dysphoric disorder (pmdd) as well as premenstrual syndrome (pms).                             |           |

### 2.1.3 Stress

| Title            | Name                          | Description   | Reference |
|------------------|-------------------------------|---|-----------|
| covid_subjective | Subjective impact of COVID-19 | Assesses the subjective impact of COVID-19 on well-being. |           |

| Title | Name   | Description   | Reference |
|-------|--|---|-----------|
| pss   | Perceived stress scale                       | The Perceived Stress Scale is a classic stress assessment instrument. This tool, while originally developed in 1983, remains a popular choice for helping us understand how different situations affect our feelings and our perceived stress. The questions in this scale ask about your feelings and thoughts during the last month. In each case, you will be asked to indicate how often. |           |
| sasrq | Stanford acute stress reaction questionnaire | Assesses the psychological symptoms experienced in the aftermath of a traumatic event.  |           |

| Title | Name                                     | Description  | Reference |
|-------|--|--|-----------|
| cte   | Childhood traumatic events questionnaire | The Childhood Traumatic Events Questionnaire is a brief survey of six early traumatic experiences (death, divorce, violence, sexual abuse, illness, and upheaval).   |           |
| ctq   | Childhood trauma questionnaire           | The Childhood Trauma Questionnaire (CTQ) is a self-report instrument covering 28 items, to rate the severity of emotional abuse and neglect, physical abuse and neglect and sexual abuse. It has been validated in terms of psychometric test properties in samples of psychiatric patients, i.e. drug and substance abusers. This data set includes five CTQ subscale scores. |           |

| Title | Name  | Description  | Reference |
|-------|---|--|-----------|
| ccfq  | Cognitive control and flexibility questionnaire | Measures an individual's perceived ability to exert control over intrusive, unwanted (negative) thoughts and emotions, and their ability to flexibly cope with a stressful situation.                      |           |
| ptgi  | Post-traumatic growth inventory                 | An instrument for assessing positive outcomes reported by persons who have experienced traumatic events.   |           |
| usq   | Undergraduate stress questionnaire              | The undergraduate stress inventory presents students with various stressors and asks them to indicate if any of the events have happened to them. They are also asked how stressed they are by this event. |           |

| Title | Name                         | Description  | Reference |
|-------|------------------------------|--|-----------|
| brcs  | Brief resilient coping scale | The Brief Resilient Coping Scale (BRCS) is a 4-item measure designed to capture tendencies to cope with stress in a highly adaptive manner |           |

#### 2.1.4 Mental health

| Title                 | Name                          | Description  | Reference |
|-----------------------|-------------------------------|--|-----------|
| stai                  | State-Trait Anxiety Inventory | The State-Trait Anxiety Inventory (STAI) is a commonly used measure of trait and state anxiety. It can be used in clinical settings to diagnose anxiety and to distinguish it from depressive syndromes. |           |
| bdi                   | Beck depression inventory     | Developed for the assessment of symptoms corresponding to criteria for diagnosing depressive disorders listed in the DSM IV  |           |
| mental_health_history | Mental health history         | A questionnaire to assess mental health history  |           |

### 2.1.5 Social

| Title  | Name  | Description   | Reference      |
|--------|---|---|----------------|
| uclals | UCLA loneliness scale                                   | A 20-item scale designed to measure one's subjective feelings of loneliness as well as feelings of social isolation.  |                |
| scq    | Social craving questionnaire                            | A measure designed to address social cravings.  | Made by BABLab |
| asc    | Adolescent social connection and coping during COVID-19 | This questionnaire is designed to learn about the ways you connect with people, and how it makes you feel. This might be affected by the COVID-19 outbreak, especially when following physical distancing or shelter-in-place orders. |                |

| Title  | Name   | Description   | Reference |
|--------|--|---|-----------|
| msspss | Multidimensional scale of perceived social support | The Multidimensional Scale of Perceived Social Support (MSPSS) is a brief research tool designed to measure perceptions of support from 3 sources: Family, Friends, and a Significant Other. The scale is comprised of a total of 12 items, with 4 items for each subscale. |           |
| scs    | Social comparison scale                            | This scale was developed by Allan and Gilbert (1995) to measure self-perceptions of social rank and relative social standing. This scale uses a semantic differential methodology and consists of 11 bipolar constructs.  |           |

### 2.1.6 Personality

| Title  | Name                             | Description   | Reference |
|--------|----------------------------------|---|-----------|
| bfi_10 | Big five personality inventory   | Inventory that measures an individual on the big five factors of personality (extraversion, agreeableness, conscientiousness, neuroticism, and openness to experience).                                   |           |
| ius    | Intolerance of uncertainty scale | The Intolerance of Uncertainty Scale includes items relating to the idea that uncertainty is unacceptable, reflects badly on a person, and leads to frustration, stress, and the inability to take action |           |

### 2.1.7 Lifestyle

| Title | Name | Description | Reference |
|-------|------|-------------|-----------|
|-------|------|-------------|-----------|

- Sleep
- Timeline
- Diet (brief food questionnaire)
- Exercise (adapt the international physical activity questionnaire - pre and during)
- Productivity

### 2.1.8 Media

- Social media use
- Traditional media consumption
- Public health information consumption

- Use of technology/new media to socialize
- Screen time usage
- smcs

### 2.1.9 Well-being

- shs

### 2.1.10 Qualitative

- Long form qualitative written response (adapted from Pennebaker, 1997)(5-10 minutes timed)

I would like for you to write about your very deepest thoughts and feelings about the way COVID-19 has affected you and your life. I'd like you to really let go and explore your very deepest emotions and thoughts. You might tie your topic to your relationships with others including parents, lovers, friends, or relatives, to your past, your present, of your future, or to who you have been, who you would like to be, or who you are now. All of your writing will be completely confidential. Don't worry about spelling, sentence structure or grammar. The only rule is that you begin writing and keep writing until 5 minutes have passed.

## 2.2 Procedure

### 2.2.1 Recruitment

Participants were recruited in two ways - via SONA and via a raffle.

The following materials were used:

### 2.2.2 Timing

Pilot time:

- Research Assistant #1 - 1 hour and 50 minutes
- Research Assistant #2 - 1 hour and 15 minutes
- Research Assistant #3 - 1 hour and 5 minutes

### 2.2.3 Questionnaire Order

1. panas (assessed 3 times - once at beginning, once before writing, once after writing)
2. information
3. somna
4. covid\_objective
5. somatic\_symptoms (assessed currently and retrospectively before COVID-19)

THE BRAIN AND BODY LAB AT UCLA PRESENTS

# INSIDE OUT STUDY

HELP US EXPLORE THE IMPACT OF COVID-19 ON  
YOUR PHYSICAL AND EMOTIONAL HEALTH

**WHAT YOU WILL DO**

Complete a confidential 1-2 hour online survey  
on topics including mental and physical health  
amid the COVID-19 pandemic.

**WHAT YOU WILL GET**

Enter to win 1 of 4  
\$50 Gift Cards!\*

**HOW TO PARTICIPATE**

Visit our website to sign up at  
[brainandbodylab.psych.ucla.edu/studies/inside-out](https://brainandbodylab.psych.ucla.edu/studies/inside-out)

PRINCIPAL INVESTIGATOR:  
DR. BRIDGET CALLAGHAN, PHD  
BABLAB.UCLA@GMAIL.COM  
(310) 909 - 7083

*\*participation in the study is not required to enter the draw; participants will  
have approximately a 1 in 40 chance of winning a gift card.*

## Chapter 3

# Study 2 - EGG - Methods

### 3.1 Information

#### 3.1.1 Enrollment

Participants will sign up for lab session slots at least 48 hours ahead of time to ensure ability to consent and complete home session. We will set the SONA to reflect the 48 hour rule as well as instruct participants that they must complete the online session before their scheduled lab session.

#### 3.1.2 Consent

The researcher will email the participant the consent form to review and sign electronically. Any questions will be answered at this time. We will direct female participants to wear a sports bra and a comfortable t-shirt. We will mention that we have a hospital gown if they prefer. We will also mention that it might be a male experimenter, so for all participants to look at the diagram and be sure they are comfortable (female experimenter can be available if necessary). We will also ask male participants if they are comfortable shaving any chest/stomach hair for the session and will send them a photo demonstrating the regions involved. We will also tell participants that their response time will be monitored, so to please read and respond carefully to all surveys.

#### 3.1.3 Home Session

- Assign the participant a Participant ID
- Log the ID, name, email address, and contact information (if given) into the ID drive
- Find the participants previous REDCap enrollment or enroll the participant on REDCap

- Email the participant (using the email template) the home session RED-Cap link, including instructions for the home and lab session.

### 3.1.4 Lab Session

Before the lab session, the researcher will check the home session submissions and record the time to completion to ensure that responses are being paid attention to, the researcher will also monitor the attention check items.

- The researcher will book the Bear's Den using the calendar system for the scheduled timeslots.
- All lab sessions take place between 12 p.m. and 6 p.m. Participants are instructed not to eat for 1 hour before their session.
- Participants will complete several questionnaires in the lab including the med\_check, female health, panas, stai\_state, and info.
- A two part SONA study will require the participant to complete the home session before the lab session.

## 3.2 Procedure

**Participants will:**

1. Drink bottle of water
2. Consent
3. Apply physiology stickers
4. Round 1 of movie watching
5. Complete PANAS
6. Round 2 of movie watching
7. Complete PANAS
8. Round 3 of movie watching
9. Complete PANAS
10. Height, weight, and waist measurement
11. Debrief

### 3.2.1 File Structure

Each participant's file should include

- 3 physio files
- 3 psychopy files
- 1 photocopy of the run sheet

### 3.2.2 Run Sheet

**Will include:**

- Observer ratings of startle scale
- Notes on laughing nervously, jumping, screaming, shrieking (to account for movement)
